10 benefits of art education: Mobile Brain-Body Imaging and the Neuroscience of Art, Innovation and Creativity Jose L. Contreras-Vidal, Dario Robleto, Jesus G. Cruz-Garza, José M. Azorín, Chang S. Nam, 2019-11-15 *Mobile Brain-Body Imaging and the Neuroscience of Art, Innovation and Creativity* is a trans-disciplinary, collective, multimedia collaboration that critically uncovers the challenges and opportunities for transformational and innovative research and performance at the nexus of art, science and engineering. This book addresses a set of universal and timeless questions with a profound impact on the human condition: How do the creative arts and aesthetic experiences engage the brain and mind and promote innovation? How do arts-science collaborations employ aesthetics as a means of problem-solving and thereby create meaning? How can the creative arts and neuroscience advance understanding of individuality and social cognition, improve health and promote life-long learning? How are neurotechnologies changing science and artistic expression? How are the arts and citizen science innovating neuroscience studies, informal learning and outreach in the public sphere? Emerging from the 2016 and 2017 International Conferences on Mobile Brain-Body Imaging and the Neuroscience of Art, Innovation and Creativity held in Cancun, Mexico and Valencia, Spain to explore these topics, this book intertwines disciplines and investigates not only their individual products—art and data—but also something more substantive and unique; the international pool of contributors reveals something larger about humanity by revealing the state of the art in collaboration between arts and sciences and providing an investigational roadmap projected from recent advances. *Mobile Brain-Body Imaging and the Neuroscience of Art, Innovation and Creativity* is written for academic researchers, professionals working in industrial and clinical centers, independent researchers and artists from the performing arts, and other readers interested in understanding emergent innovations at the nexus of art, science, engineering, medicine and the humanities. The book contains language, design features (illustrations, diagrams) to develop a conversational bridge between the disciplines involved supplemented by access to video, artistic presentations and the results of a hackathon from the MoBI conferences.

10 benefits of art education: Neuroscience and Art Amy Ione, 2024-08-27 This book is focused on how understanding ourselves as humans is incomplete without considering both biological and cultural aspects. Using the neurocultural perspective, the book explores how everything in the world is filtered back and forth through the brain and culture. The thrust of the book, therefore, is to explore the power of art in creating a bridge between cultural and neuroscientific lines of inquiry. Looking at both clinical and non-clinical populations, the text examines historical foundations, distinguishes congenital/developmental conditions from those that are acquired, and emphasizes how the brain constructs our sensory experiences. Several distinctive features separate this research from other publications. First, the book opens with a review of how the historical literature is still etched into the ideas we employ to explain elements across the interdisciplinary fields of art, aesthetics, our sensory experience, psychology, cognition, and well-being. Second, the research adopts a humanistic rather than a philosophical or social science perspective in demonstrating the value of coupling anatomy and physiology with the natural and social environment. In this, artists from all genres are incorporated. Among them are Iris Murdoch, Ludwig van Beethoven, Leonardo da Vinci, Cristoforo de Predis, Rembrandt, Federico Fellini, Chuck Close, and David Hockney. Case studies demonstrate how neuroscientific research meshes with art, individual, and cultural variables in ways that range from health and well-being to physiological decline and biological traumas. These include a case study that examines how Oliver Sacks combined biology and biography in his

writings. It also explores art projects in several genres inspired by his studies. Another case study is on the role of film as a useful clinical tool. Here the book also demonstrates that cinematic devices used by filmmakers intersect with perceptual and cognitive neuroscience. A defining feature of the analysis is the integration of research on brain injuries with humanistic responses in film, literature, and the visual arts. This section outlines the lack of consensus regarding the causes and treatment of “shell shock” in World War I before introducing how research and art now work with PTSD/TBI. Finally, the book examines therapeutic cases of professional and non-professional artists, concluding with a discussion of synesthesia and the senses.

With its evidence-based but highly accessible approach, this book will be directly and immediately relevant to those interested in the Arts as a force for change in schooling. How Arts Education Makes a Difference discusses: The Arts Education, Motivation, Engagement and Achievement Research Visual Arts, Drama and Music in Classrooms Technology-mediated Arts Engagement International Perspectives on Arts and Cultural Policies in Education This book is a timely collation of research and experiential findings which support the need to promote arts education in schools worldwide. 10 benefits of art education: The Necessity of Aesthetic Education Laura D'Olimpio, 2024-04-04 The Necessity of Aesthetic Education is a manifesto. That which is experienced through engagement with art, through the many various and diverse art forms and media, is uniquely and essentially valuable to the lives of human beings. In order to fully appreciate and gain the most out of the arts, which offer a variety of aesthetic experience, there are concepts, skills and techniques integral to such understanding. In this book, Laura D'Olimpio argues that aesthetic education ought to be a compulsory part of education for all school-aged students, from pre-primary to high school, on the basis of its distinctive value. Such an argument is timely, given the so-called crisis in the arts and humanities, with declining student numbers in subjects that do not have a direct vocational correlative, and increased focus on science, engineering, technology and mathematics (STEM) subjects. As funding cuts increasingly slash the support for the arts, there is a need to argue for why the arts and arts education is valuable, for their own sake, as well as for the positive contributions they can and do make to society. Through critical engagement with a range of thinkers including Maxine Greene, John Dewey and Elliot Eisner, D'Olimpio offers a unique and important contribution to aesthetic education, and to research within philosophy of education.
