Overview of CPT Codes for Flu and COVID Testing

The Current Procedural Terminology (CPT) codes are standardized codes used to describe medical, surgical, and diagnostic services. When it comes to infectious disease testing, such as for influenza and COVID-19, CPT codes provide a uniform language for reporting and billing. Distinguishing between flu and COVID testing requires familiarity with the specific codes assigned to different types of tests, including molecular assays, antigen detection, and multiplex panels. Accurate use of the cpt code for flu and covid test is crucial for ensuring proper reimbursement and compliance with payer requirements.

These codes are updated regularly by the American Medical Association (AMA) to reflect advances in testing technology and public health needs. Healthcare providers must stay informed about these changes to maintain coding accuracy.

CPT Codes for Influenza Testing

Influenza testing is performed using various methods such as rapid antigen detection tests, molecular assays like PCR, and immunofluorescence assays. Each method corresponds to specific CPT codes that describe the procedure performed. Selecting the correct CPT code for flu testing depends on the test type and the laboratory or point-of-care setting.

Common CPT Codes for Influenza Testing

Below are frequently used CPT codes for influenza diagnostic tests:

- **87804**: Infectious agent antigen detection by immunoassay technique, influenza virus
- **87501**: Infectious agent detection by nucleic acid (DNA or RNA); influenza virus, amplified probe technique
- **87400**: Infectious agent detection by nucleic acid (DNA or RNA); influenza virus, direct probe technique

These codes differ based on the methodology: antigen detection (rapid tests), amplified probe (PCR), or direct probe (non-amplified nucleic acid). Proper documentation specifying the test type is necessary to support code selection.

Special Considerations for Influenza Testing Codes

It is important to note that some payers may have specific requirements regarding flu testing CPT codes. For example, rapid influenza diagnostic tests (RIDTs) are commonly billed using 87804, but PCR tests require 87501. Inpatient and outpatient settings may also influence coding decisions. Furthermore, when influenza testing is part of a broader respiratory panel, different CPT codes may apply.

CPT Codes for COVID-19 Testing

COVID-19 testing utilizes a range of diagnostic methods, including molecular tests (RT-PCR), antigen tests, and antibody tests. The CPT codes for COVID-19 testing were introduced rapidly in response to the pandemic and have been updated regularly to accommodate new testing modalities and reporting requirements.

Molecular and Antigen COVID-19 Testing Codes

The primary CPT codes for COVID-19 diagnostic testing include:

- **87635:** Infectious agent detection by nucleic acid (DNA or RNA), SARS-CoV-2 (COVID-19), amplified probe technique
- **87811:** Infectious agent antigen detection by immunoassay technique, SARS-CoV-2 (COVID-19)

Code 87635 is used for RT-PCR and other nucleic acid amplification tests (NAATs), which are considered the gold standard for COVID-19 diagnosis. Code 87811 applies to rapid antigen tests that provide faster results but may have variable sensitivity.

COVID-19 Antibody Testing Codes

While not diagnostic, antibody tests to detect past COVID-19 infection have separate CPT codes, such as:

- **86769:** Antibody detection for SARS-CoV-2, qualitative or semiquantitative

These are generally used for serologic surveillance rather than active infection diagnosis.

Combined Flu and COVID Testing CPT Codes

Given the overlap in symptoms and the concurrent circulation of influenza and SARS-CoV-2 viruses, combined testing panels have become increasingly common. CPT codes exist to describe multiplex assays that detect both influenza viruses and COVID-19 in a single test.

Multiplex Panel CPT Codes

Key CPT codes for combined flu and COVID testing include:

- **87631:** Infectious agent detection by nucleic acid (DNA or RNA), respiratory virus panel including influenza A, influenza B, and SARS-CoV-2
- **87632:** Infectious agent detection by nucleic acid (DNA or RNA), respiratory virus panel with extended targets including influenza and COVID-19

These multiplex panels offer efficiency by simultaneously testing for multiple pathogens, facilitating faster diagnosis and treatment decisions. The use of these CPT codes requires careful documentation to reflect the panel's scope and the pathogens tested.

Billing Challenges for Combined Testing

When submitting claims for combined flu and COVID testing, it is vital to avoid duplicate billing for individual tests covered within a multiplex panel. Insurance payers may have specific guidelines on coverage and reimbursement for these panels, so coders must verify payer policies and ensure that claims accurately reflect the performed services.

Billing and Documentation Best Practices

Proper billing and documentation are essential components of utilizing the cpt code for flu and covid test effectively. Accurate coding not only supports reimbursement but also ensures compliance with regulatory requirements and facilitates public health reporting.

Essential Documentation Elements

Documentation accompanying flu and COVID testing should include:

- Type of test performed (e.g., antigen, PCR, multiplex panel)
- Specimen source and collection date
- Test results, if available at the time of billing
- Clinical indications justifying the test
- Laboratory or point-of-care setting details

Common Billing Considerations

Several billing considerations apply when coding for flu and COVID tests:

- Use of modifier codes when applicable
- Adhering to payer-specific guidelines and coverage policies
- Avoiding unbundling or duplicate billing

- Monitoring updates to CPT codes and reimbursement rules

Staying current with coding changes and payer instructions helps reduce claim denials and expedites payment processing.
