current medical research opinion: Non-Communicable Disease Prevention: Best Buys, Wasted Buys and Contestable Buys Wanrudee Isaranuwatthai, Rachel A. Archer, Yot Teerawattananon, Anthony J. Culyer, 2019-12-12 Non-communicable diseases (NCDs) are the leading cause of death worldwide, contributing to over 73% of all deaths annually. Each day NCDs cause more than 100,000 deaths, 80% of which occur in low- and middle-income countries. NCDs, however, are largely preventable, and a great deal of technical knowledge exists about how to prevent and manage them. Why, then, have we, as a global community, not been more successful at reducing this NCD burden? Does a universal problem not have a universal solution? Created by an international consortium of experts, this informative and accessible book provides practical guidelines, key learning points, and dynamic, real-world case studies to aid NCD program managers, policy officers and decision-makers in low- and middle-income countries, so that they can assess interventions for the prevention and control of NCDs. The book was commissioned by the Prince Mahidol Award Conference (PMAC), an annual international conference centred on policy of global significance related to public health. Non-Communicable Disease Prevention: Best Buys, Wasted Buys and Contestable Buys emphasises the importance of context in NCD control and prevention, arguing that the success of an intervention lies in an ability to respond to local needs and environments. The book comprises ten chapters, which collectively explore the reasons behind, and strategies for, preventing and managing the NCD burden. It spans key themes such as political economy, the transferability of economic evidence, the role of cross-sectoral policies, the importance of deliberative processes, and health technology assessment. This book is written for the benefit of the global health community, and is primarily targeted at those individuals who are involved in NCD programs. This book will also be of interest to NCD champions, policy advocates, and educators spearheading the movement for increased visibility of NCDs.

current medical research opinion: Aging 2000: Our Health Care Destiny Charles M. Gaitz, T. Samorajski, 2012-12-06 The seventeenth annual symposium sponsored by the Texas Research Institute of Mental Sciences was held October 23-26, 1983, in Houston, Texas. The theme was Aging 2000: Our Health Care Destiny. This volume on biomedical aspects and a companion volume on psycho social aspects include edited versions of the presentations by about 80 speakers. Their papers were directed at practitioners, researchers, and medical educators who will be active and productive in the year 2000, and we focused on those who would influence the evolution of care of elderly persons during the next 17 years. We chose topics that would be of particular interest to teachers and current planners in the disciplines concerned with delivery of health and social services. We believe that having a core of more qualified and better trained practitioners will help the population of aged persons achieve a higher level of physical and mental health, life satisfaction and happiness, to find better coping techniques and control of environmental stresses, and to attain personal and social goals. Our Goals While preparing for the symposium we knew that the status of the art in 1983 obviously would be the base from which we would work, but we asked our speakers to give priority to future planning and directions.

current medical research opinion: *Exercised* Daniel Lieberman, 2021-01-05 If exercise is healthy (so good for you!), why do many people dislike or avoid it? These engaging stories and explanations will revolutionize the way you think about exercising—not to mention sitting, sleeping, sprinting, weight lifting, playing, fighting, walking, jogging, and even dancing. “Strikes a perfect balance of scholarship, wit, and enthusiasm.” —Bill Bryson, New York Times best-selling author of *The Body* • If we are born to walk and run, why do most of us take it easy whenever possible? • Does running ruin your knees? • Should we do weights, cardio, or high-intensity training? • Is sitting really the new smoking? • Can you lose weight by walking? • And how do we make sense of the conflicting, anxiety-inducing information about rest, physical activity, and exercise with which we are bombarded? In this myth-busting book, Daniel Lieberman, professor of human evolutionary biology at Harvard University and a pioneering researcher on the evolution of human physical activity, tells the story of how we never evolved to exercise—to do voluntary physical activity for the sake of health. Using his own research and experiences throughout the world, Lieberman recounts without jargon how and why humans evolved to walk, run, dig, and do other necessary and rewarding physical activities while avoiding needless exertion. *Exercised* is entertaining and enlightening but also constructive. As our increasingly sedentary lifestyles have contributed to skyrocketing rates of obesity and diseases such as diabetes, Lieberman audaciously argues that to become more active we need to do more than medicalize and commodify exercise. Drawing on insights from evolutionary biology and anthropology, Lieberman suggests how we can make exercise more enjoyable, rather than shaming and blaming people for avoiding it. He also tackles the question of whether you can exercise too much, even as he explains why exercise can reduce our vulnerability to the diseases mostly likely to make us sick and kill us.

current medical research opinion: *The Skeptical Professional's Guide to Psychiatry* Charles E. Dean, 2020-11-22 This text critically examines the shortcomings of psychiatry; the flawed development of the diagnostic system, including the DSM-5; and the failure to advance the effectiveness of antipsychotics and antidepressants. Starting with an overview of the evolution of psychiatry, Dean explores the creation, use, and misuse of medications, a process largely driven by drug companies. Other chapters describe the benefits and risks of medications, the problems associated with rational prescribing, and the embrace of so-called novel therapies including hallucinogenic drugs and opioids. Chapters end with a set of clinical notes that provide specific recommendations to clinicians, families, patients, and other providers, emphasizing the risks and benefits of treatment with medications but also stressing alternative approaches. This book will challenge clinicians to think critically about the DSM-5 and the current systems of diagnosis and treatment of mental illnesses in the hopes of ultimately improving the lives of people with mental illnesses.
