d g automotive technology: Gas-Turbine Regenerators Douglas Beck, David G. Wilson, 2012-12-06 Regenerative gas turbines are attractive alternatives to diesel engines and spark ignition engines for automobiles and to diesel engines and combined-cycle en gines for power generation. Theory indicates regenerative gas turbines should achieve higher thermal efficiencies than those of diesel engines and combined cycle engines. Further, regenerative gas turbines are potentially lower in cost, require less maintenance, require less space, and pollute less than competitive systems. Regenerators can be used for exhaust-gas heat exchange or for intercooling in gas-turbine systems. As an exhaust-gas heat exchanger, a regenerator recovers heat from the exhaust and uses it to preheat the compressed air before the compressed air enters the combustor. Preheating of the compressed air permits a small heat input to the combustor for a given power output of the engine. As an intercooler, a regenerator cools the gas between compressor stages. Less work is required to compress cool gas than is required to compress warm gas. Therefore, a regenerator intercooler can reduce the required work input to the compressor. Thus, regenerators can be used to increase the thermal efficiencies and power outputs of gas turbines. the backbones of high-performance re High-performance regenerators are generative gas turbines. In the past, lack of understanding of regenerator per formance has led to sub-optimal engine designs. Now this book gives com prehensive regenerator information. With this book, the designer can design regenerators that will yield gas turbines with maximum thermal efficiencies.

d g automotive technology: Advanced Technologies and Methodologies for Risk Management in the Global Transport of Dangerous Goods Azedine Boulmakoul, Emmanuel Garbolino, 2008-09-15 In the last few years, logistics has become a strategic factor for development and competition. In fact, research and development activities have traditionally faced the management of supply chain and international transport focussing on two main aspects: speed and efficiency. However, several vulnerabilities have recently been highlighted under a safety and security viewpoint. The weakness of the logistic chains has become more evident with the beginning of the new millennium. Terrorist attacks, such as the 11th of September 2001 in the USA, have caused the introduction of new rules and procedures, which affect the overall logistics showing the vulnerability of the global economy. So, nowadays, it would appear anachronistic to carry out an exhaustive research activity on the
