foresight mental health patient portal: High Tech, High Touch Norina Gasteiger, 2019 Background: Poor mental health and distress pose significant health risks to young people in New Zealand. Patient portals have the potential to increase access to mental health services, including in university-based health practices. However, a lack of research is available to guide practices on

extending patient portals into mental health services. Aim: This study aimed to explore stakeholder (student service users' and health providers') expectations and perceptions of extending patient portals into a New Zealand university based mental health service. Methods: This qualitative study was conducted collaboratively with the University Health and Counselling Service, through an action research methodology. The convergent interviewing method included a software demonstration, two staff focus groups and 13 interviews with a total of 17 students and staff. Data was analysed thematically. Findings: Data converged into 15 themes, categorised into perceptions of the patient portal and considerations and opportunities for extension. The existing portal was perceived as useful and easy to use. Participants reported that it plays a vital role in making health care more accessible and expected this to transfer to a mental health context. Staff were most concerned with the portal's ability to support their triage processes and enabling students to 'counsellor hop' - see multiple counsellors. Staff recommended extension into low-risk services. Most students expected the portal to enhance patient counsellor contact and rapport, through continuity of care. Students were concerned with appointment waiting times, the stigmatisation of poor mental health and their capacity to seek help. Students recommended extension into all services, including urgent appointments. In the final phase of the research, staff concluded that extending a patient portal into their counselling services should be prioritised. Conclusions: This is the first study to explore a patient portal in primary mental health care. Staff tended to prefer a high touch, low technology model of mental healthcare delivery, while students desired for the portal to fast-track administration and triage processes. This research suggests that there is value in extending patient portals into mental health care, especially into low-risk services. Future research should explore opportunities to support triage and appointment making processes via patient portals, to find a balance of high tech and high touch.

foresight mental health patient portal: The Mental Health Professional and the New Technologies Marlene M. Maheu, Myron L. Pulier, Frank H. Wilhelm, Joseph P. McMenamin, Nancy E. Brown-Connolly, 2004-09-22 In the last two decades, new communication technologies have dramatically changed the world in which mental health professionals and their patients live. Developments such as e-mail, online chat groups, Web pages, search engines, and electronic databases are directly or indirectly affecting most people's routines and expectations. Other developments are poised to do so in the near future. Already, for example, patients are acquiring both good and bad advice and information on the Web; many expect to be able to reach their therapists by e-mail. And already there is pressure from third party payers for providers to submit claims electronically. These technological breakthroughs have the potential to make mental health care more widely available and accessible, affordable, acceptable to patients, and adaptable to special needs. But many mental health professionals, as well as those who train them, are skeptical about integrating the new capabilities into their services and question the ethical and legal appropriateness of doing so. Those unfamiliar with the technologies tend to be particularly doubtful. How much e-mail contact with patients should I encourage or permit, and for what purposes? Why should I set up a Web site and how do I do so and what should I put on it? Should I refer patients to chat groups or Web-based discussion forums? Could video-conferencing be a helpful tool in some cases and what is involved? How do I avoid trouble if I dare to experiment with innovations? And last but not least, will the results of my experimentation be cost-effective? The book includes: an extensive overview of legal and regulatory issues, such as those raised by the Health Insurance Portability and Accountability Act (HIPAA); concrete technical, ethical, and managerial suggestions summarized in a seven-step Online Consultation Risk Management model; and how to resource lists and sample documents of use to beginners and experienced professionals alike. For better or worse, no mental health professional today can avoid confronting the issues presented by the new technologies. *The Mental Health Professional and the New Technologies: A Handbook for Practice Today* will enormously simplify the job of thinking through the issues and making clinically, ethically, and legally prudent decisions.

foresight mental health patient portal: Patient Engagement Diane P. Fabian, 2021 The

patient portal is an electronic repository of health information, including doctor's notes, laboratory test results, and diagnostic imaging reports. There are limited studies that explore how individuals make sense of their health information, and use that understanding to increase health literacy. Education leaders should consider the ways that students in allied health care fields might better understand the role of the portal, the federal investment in developing electronic records, and the perceived value of the portal by patients. The purpose of this study was to explore portal usage among employees at Suffolk County Community College, individuals' experience with the health care environment, the individuals' understanding of health information, and how these influence the individuals to become a more active participant in their own health care. To do so, this quantitative study examined the relationship between individual attributes, including health status, and education level that may determine a patient's perceived value of the portal as measured by portal usage. Factors measured include individual beliefs that a patient can master the portal, the environment that supports the individuals, and their health literacy. The participants of the survey study were individuals employed by Suffolk County Community College. A twenty item self-reported questionnaire measured key variables in the study. Section one of the instrument including independent variables, demographic characteristics, health literacy, education level, and health status. The dependent variable is patient portal usage. A multiple linear regression analysis was conducted to test the null hypothesis to determine if health literacy, education level, and health status can predict portal usage. A Pearson's correlation was used to examine the relationship between health literacy and portal usage, education level and portal usage, and health status and portal usage. An independent-samples t-test was conducted to compare portal usage with health status, specifically for major and minor health issues. Descriptive statistics also provided information for consideration. The findings support previous literature that indicates health status and health literacy are significant predictors of portal usage, and provide considerations for educational leaders in allied health.

foresight mental health patient portal: Caring for People with Mental Health and Substance Use Disorders in Primary Care Settings National Academies of Sciences, Engineering, and Medicine, Health and Medicine Division, Board on Health Sciences Policy, Board on Health Care Services, Forum on Mental Health and Substance Use Disorders, 2021-01-30 Behavioral health conditions, which include mental health and substance use disorders, affect approximately 20 percent of Americans. Of those with a substance use disorder, approximately 60 percent also have a mental health disorder. As many as 80 percent of patients with behavioral health conditions seek treatment in emergency rooms and primary care clinics, and between 60 and 70 percent of them are discharged without receiving behavioral health care services. More than two-thirds of primary care providers report that they are unable to connect patients with behavioral health providers because of a shortage of mental health providers and health insurance barriers. Part of the explanation for the lack of access to care lies in a historical legacy of discrimination and stigma that makes people reluctant to seek help and also led to segregated and inhumane services for those facing mental health and substance use disorders. In an effort to understanding the challenges and opportunities of providing essential components of care for people with mental health and substance use disorders in primary care settings, the National Academies of Sciences, Engineering, and Medicine's Forum on Mental Health and Substance Use Disorders convened three webinars held on June 3, July 29, and August 26, 2020. The webinars addressed efforts to define essential components of care for people with mental health and substance use disorders in the primary care setting for depression, alcohol use disorders, and opioid use disorders; opportunities to build the health care workforce and delivery models that incorporate those essential components of care; and financial incentives and payment structures to support the implementation of those care models, including value-based payment strategies and practice-level incentives. This publication summarizes the presentations and discussion of the webinars.

foresight mental health patient portal: Digital Mental Health Ives Cavalcante Passos, Francisco Diego Rabelo-da-Ponte, Flavio Kapczynski, 2023-01-01 This innovative book focuses on

potential, limitations, and recommendations for the digital mental health landscape. Authors synthesize existing literature on the validity of digital health technologies, including smartphones apps, sensors, chatbots and telepsychiatry for mental health disorders. They also note that collecting real-time biological information is usually better than just collect filled-in forms, and that will also mitigate problems related to recall bias in clinical appointments. Limitations such as confidentiality, engagement and retention rates are moreover discussed. Presented in fifteen chapters, the work addresses the following questions: may smartphones and sensors provide more accurate information about patients' symptoms between clinical appointments, which in turn avoid recall bias? Is there evidence that digital phenotyping could help in clinical decisions in mental health? Is there scientific evidence to support the use of mobile interventions in mental health? Digital Mental Health will help clinicians and researchers, especially psychiatrists and psychologists, to define measures and to determine how to test apps or usefulness, feasibility and efficacy in order to develop a consensus about reliability. These professionals will be armed with the latest evidence as well as prepared to a new age of mental health.

foresight mental health patient portal: Privacy and Confidentiality in Mental Health Care John J. Gates, Bernard S. Arons, 2000 Rapid changes in technology and health care management practices have provoked valid questions about the growing accessibility of confidential medical records. How do professionals balance an individual's right to privacy with effective treatment and insurance company demands? What policies can prevent the misuse of sensitive information stored in large, widely used databases? In this book, leading authorities explore the privacy of mental health information from legal, technological, and clinical perspectives and analyze the implications for consumers, families, policy makers, researchers, insurance companies, and mental health care providers.

foresight mental health patient portal: Factors Associated with Patient Portal Utilization, Preventive Services Utilization, and Health Promoting Behaviors Among Adults in the United States Elizabeth Ayangunna, 2023 Author's abstract: Background: Nearly 60% of adults in the United States are estimated to have one or more chronic conditions, necessitating strategies to improve the health status of persons with chronic disease. Given that health information technology (HIT) is considered highly valuable for superior disease management, it is imperative to examine how HIT use can improve health behaviors, which can in turn improve health status. This study aimed to examine if there was an association between patient portal utilization and the use of preventive services & health-promoting behaviors. Also, this study examined the influence of self-efficacy on preventive health behaviors among adults in the United States. Methods: This study analyzed secondary data from the nationally representative Health Information National Trends Survey 5 combined dataset from 2017 to 2020. Data analysis was restricted to respondents who had used their patient portals in the past year and the sample size was 14,103. Binomial & multinomial logistic regression models were conducted for this study. Results: Patient portal utilization was significantly associated with preventive health behaviors such as pap smear testing, mammogram screening, non-smoking, levels of participation in physical activities, and muscle-strengthening activities. Self-efficacy was significantly associated with mammogram screening and the levels of participation in physical and muscle-strengthening activities. Conclusion: The study provides information that suggests that stakeholders need to encourage the population to use their patient portals. Also, optimizing the patient portals for not just clinical care but preventive care may reduce the incidence and cost of chronic diseases.

foresight mental health patient portal: Behavioral Emergencies for Healthcare Providers Leslie Zun, Kimberly Nordstrom, Michael P. foresight mental health patient portal: *The Primary Care Toolkit* Larry James, William O'Donohue, 2008-10-27 Integrated care is receiving a lot of attention from clinicians, administrators, policy makers, and researchers. Given the current healthcare crises in the United States, where costs, quality, and access to care are of particular concern, many are looking for new and better ways of delivering behavioral health services. Integrating behavioral health into primary care medical settings has been shown to: (1) produce healthier patients; (2) produce medical savings; (3) produce higher patient satisfaction; (4) leverage the primary care physician's time so that they can be more productive; and (5) increase physician satisfaction. For these reasons this is an emerging paradigm with a lot of interest and momentum. For example, the President's New Freedom Commission on Mental Health has recently endorsed redesigning the mental health system so that much of this is integrated into primary care medicine.

foresight mental health patient portal: *Using the Electronic Patient Portal to Engage Patients with Multiple Chronic Conditions* Kimberly Ryan Powell, 2017 Three in four Americans aged 65 and older is living with multiple chronic conditions. These patients have complex care needs and stand to benefit from tools facilitating engagement in their healthcare. Little is known regarding use of the electronic patient portal as a tool to support self-care in patients with multiple chronic conditions. The purpose of this multiple-methods study was to (1) explore characteristics and patterns of portal use by patients with multiple chronic conditions and (2) to understand the perceived usefulness of this tool to improve self-care. In phase 1, the quantitative phase, data from electronic health records and web server log files were analyzed. Patients (n=500) who were 45 years or older, registered portal users, and diagnosed with at least two chronic conditions were included in the analysis. No significant differences in portal use were found according to demographic characteristics, distance separating the patient from their primary care provider, and practice size and location. There was a significant difference between patients who accessed the portal to send a message to the provider and patient entered data in regards to logins (p
