free science word search: Statistics Applied to Clinical Studies Ton J. Cleophas, Aeilko H. Zwinderman, 2012-02-09 Thanks to the omnipresent computer, current statistics can include data files of many thousands of values, and can perform any exploratory analysis in less than seconds. This development, however fascinating, generally does not lead to simple results. We should not forget that clinical studies are, mostly, for confirming prior hypotheses based on sound arguments, and the simplest tests provide the best power and are adequate for such studies. In the past few years the authors of this 5th edition, as teachers and research supervisors in academic and top-clinical facilities, have been able to closely observe the latest developments in the field of clinical data analysis, and they have been able to assess their performance. In this 5th edition the 47 chapters of the previous edition have been maintained and upgraded according to the current state of the art, and 20 novel chapters have been added after strict selection of the most valuable and promising novel methods. The novel methods are explained using practical examples and step-by-step analyses readily accessible for non-mathematicians. All of the novel chapters have been internationally published by the authors in peer-reviewed journal, including the *American Journal of Therapeutics*, the *European Journal of Clinical Investigation*, the *International journal of Clinical Pharmacology and therapeutics*, and other journals, and permission is granted by all of them to use this material in the current book. We should add that the authors are well-qualified in their fields of knowledge. Professor Zwinderman is president-elect of the International Society of Biostatistics, and Professor Cleophas is past-president of the American College of Angiology. From their expertise they should be able to make adequate selections of modern methods for clinical data analysis for the benefit of physicians, students, and investigators. The authors, although from a different discipline, one clinician and one statistician, have been working and publishing together for over 10 years, and their research of statistical methodology can be characterized as a continued effort to demonstrate that statistics is not mathematics but rather a discipline at the interface of biology and mathematics. They firmly believe that any reader can benefit from this clinical approach to statistical data analysis.

free science word search: Free Thought, Faith, and Science Roger Pullin, 2014-10-10 FREE THOUGHT, FAITH AND SCIENCE: FINDING UNITY THROUGH SEEKING TRUTH By Roger Pullin. This book covers a hot topic – can faith, defined as personal belief and trust in God and not as a religious affiliation, ever be compatible with science? Dr. Roger Pullin argues forcefully that faith and science are complementary paths to truth, with all truthful spiritual insights and all truthful disclosures through mathematics and science coming from God, and that through faith and science we approach one whole body of truth. He writes as a marine biologist with a long career in research, teaching and consulting, mostly in tropical developing countries, and as a believer. He is an Associate Member of Christians in Science and the Society of Ordained Scientists, a Member of the Science and Religion Forum and a Member and former Elder of the Union Church of Manila, Philippines. Dr. Pullin draws together threads from works across theology and science and from personal experiences to offer fresh perspectives on what he calls Free Thought. Free Thought has capital letters to distinguish it from our basic thought about the practicalities of life - what to eat, what to wear, how to dodge traffic etc. Free Thought is not freethinking, as defined conventionally by an outcome of dissent from some religious or other established order. No process defined by a specific outcome can be called free. Free Thought can have any outcome, including agnosticism, atheism and faith. Free Thought is founded on free will. Everyone is free to explore all available information and to choose what to believe. No one knows what anyone else truly believes. Free Thought is truly free. Every human self is a unique combination of a material mind-body with a spiritual soul. Free Thought is the integrated and iterative processing of information from the

material and spiritual realms, in one or more common nonmaterial formats, across an individual mind-soul interface. Free Thought connects the material and spiritual realms in every person. Our Free Thought and mind-soul interfaces make us the agents by which God and the spiritual force for evil can bring about change in the material realm. The laws of nature are not suspended to allow so-called miracles. We have free will. The material realm works through free process. From this perspective, Dr. Pullin reviews the human condition, faith, science, the battlefields on which we seek truth in the midst of lies and nonsense and make moral choices, the need for reformations in organized religion and revolutions in science and the prospects for faith-science unity. He recommends expansion of faith-science quest for truth, by scientific appraisals of subjective evidence from within believers and nonbelievers and by considering the implications of a spiritual realm for brain and consciousness research and a theory of everything. This book's 11 chapters can be adapted as a series of lectures. It depicts a model and mechanisms for Free Thought in a 6-part Figure 1, the backdrop to which forms the cover design, and a synthetic Figure 2. Its 5 Appendices provide definitions of terms, summaries of the author's beliefs and background, reviews of related literature and a questionnaire for readers. Its total length is 431 pages, plus a user-friendly Index.
