free patient navigator training: Establishing Effective Patient Navigation Programs in Oncology National Academies of Sciences, Engineering, and Medicine, Health and Medicine Division, Board on Health Care Services, National Cancer Policy Forum, 2018-07-13 Delivering high-quality cancer care to all patients presents numerous challenges, including difficulties with care coordination and access. Patient navigation is a community-based service delivery intervention designed to promote access to timely diagnosis and treatment of cancer and other chronic diseases by eliminating barriers to care, and has often been proposed and implemented to address these challenges. However, unresolved questions include where patient navigation programs should be deployed, and which patients should be prioritized to receive navigation services when resources are limited. To address these issues and facilitate discussion on how to improve navigation services for patients with cancer, the National Cancer Policy Forum of the National Academies of Sciences, Engineering, and Medicine held a workshop on November 13 and 14, 2017. At this workshop, a broad range of experts and stakeholders, including clinicians, navigators, researchers, and patients, explored which patients need navigation and who should serve as navigators, and the benefits of navigation and current gaps in the evidence base.

free patient navigator training: Team-Based Oncology Care: The Pivotal Role of Oncology Navigation Lillie D. Shockney, 2018-04-10 This book discusses how effective navigation requires a team approach to oncology care and should never be considered an “add-on” resource or service. The Academy of Oncology Nurse & Patient Navigators (AONN) is the only national professional organization for navigation professionals, and has more than 6,000 members, 90% of which are oncology nurse navigators. They are the experts on creating team-based programs, which remove the risk of others trying to reinvent the wheel by designing a navigation program from scratch. They also understand the role of effective navigation across the entire continuum of care, and understand and are able to apply other key aspects of navigation, including clinical trial screenings and tumor board coordination and monitoring, as well as measurement using evidence-based navigation metrics, to name but a few. It is the only book designed to educate and support anyone developing a new navigation program, or wanting to improve one they have created. As such it offers a guide for cancer centers needing to develop and implement an oncology navigation program; understand and successfully meet and exceed the Commission on Cancer accreditation standards linked to navigation; expand or improve their current navigation program as well as demonstrate its value using reliable measurable results, including patient satisfaction and improved- quality clinical outcomes. This comprehensive book also provides insights into applying the information presented to the real world of oncology care.

free patient navigator training: Free Clinics Virginia M. Brennan, 2013-05-15 Free clinics and student-run clinics are an essential part of America's health care safety net. In community after community, pro bono and student-run health clinics have sprung up over the past 30 years,

providing critically needed care to medically underserved populations. Free Clinics is a mosaic formed by accounts of such clinics around the United States. These wide-ranging narratives—from urban to rural, from primary care to behavioral health care—provide examples that will assist other communities seeking to find the model that best fits their needs. The Patient Protection and Affordable Care Act has improved access to health care for many Americans, but millions remain and will remain uninsured or underinsured. Free clinics provide non-emergency care to those in need. Nationwide, professionals can be found offering volunteer services at these clinics. Contributors to this volume—typically people with personal familiarity (as clinicians or area residents) with the clinics they write about—cover a variety of topics, including a review of the literature, data-driven accounts of clinic usage, and ethical guidelines for student-run clinics. They describe the motivations of clinic staff, the day-to-day work of a family nurse practitioner working in clinics and teaching at a university, the challenges and rewards of providing health care for homeless people, and more. Student-run clinics are the topic of the second section: in addition to providing care to a small subset of those in need, student-run clinics are an important venue for training future clinicians and helping the seeds of altruism with which many enter their professions to germinate. Free Clinics will be useful to policymakers, students and faculty in public health and health policy programs, and clinicians and students who are embarking on launching new clinics.

free patient navigator training: Cancer Health Disparities Chanita Hughes Halbert, PhD, 2023-11-08 Despite improvements in strategies for early detection and cancer treatment, racial and ethnic groups and individuals from other medically underserved populations continue to experience disparities in cancer morbidity and mortality. Research in cancer health disparities has evolved from first generation studies that described racial differences in morbidity and mortality to research that examines the efforts of interventions that focus on increasing access to early detection and treatment. As a result of these efforts, racial background, socioeconomic characteristics, access to high quality cancer care, and psychological and social factors have been documented as important determinants of cancer health disparities; these factors provide the context within which cancer is detected, treated, and prevented. The field of cancer health disparities is now at a critical juncture where it is essential to move beyond descriptive information on determinants of disparities in cancer morbidity and mortality to translational studies that examine basic biological processes and how these processes interact with social, psychological, and behavioral factors to contribute to disparities in cancer risk and outcomes. Empirical evidence about the influence of multilevel determinants has grown, and now, more than ever, efforts are being made to understand the independent and interactive effects of biological, psychological, behavioral, and social determinants of cancer health disparities and to translate this information into sustainable interventions for cancer prevention, control, and treatment. Provides an in-depth examination of emerging evidence about multilevel determinants of cancer health disparities Describes novel frameworks and

approaches that are being used to understand and address cancer health disparities Presents evidence-based interventions that have potential to achieve equity in cancer outcomes Reviews the effects of previous and ongoing approaches to address disparities
