Understanding Long COVID and Its Symptoms

Long COVID, also known as post-acute sequelae of SARS-CoV-2 infection (PASC), refers to a range of symptoms that persist for weeks or months after the initial COVID-19 illness has resolved. Patients commonly report fatigue, cognitive impairment (often described as brain fog), shortness of breath, chest pain, joint pain, and sleep disturbances. These symptoms can significantly impair quality of life and daily functioning.

Common Symptoms Associated with Long COVID

Long COVID symptoms vary widely but often include:

- Chronic fatigue and exhaustion
- Difficulty concentrating and memory problems

- Dyspnea or shortness of breath
- Persistent cough and chest discomfort
- Muscle and joint pain
- Sleep disturbances and insomnia
- Headaches and dizziness
- Psychological effects such as anxiety and depression

Pathophysiology of Long COVID

The underlying causes of long COVID are complex and multifactorial, involving persistent inflammation, microvascular damage, immune dysregulation, and tissue hypoxia. These factors contribute to ongoing organ dysfunction and delayed recovery. Due to the hypoxic environment in affected tissues, therapies aimed at improving oxygen delivery, such as hyperbaric oxygen therapy, are being investigated as potential treatments.

Principles of Hyperbaric Oxygen Therapy

Hyperbaric oxygen therapy (HBOT) involves the administration of 100% oxygen at pressures greater than atmospheric pressure, typically within a specialized chamber. This process significantly increases the amount of dissolved oxygen in the blood plasma, enhancing oxygen delivery to tissues, promoting angiogenesis, and facilitating cellular repair mechanisms.

How HBOT Works

Under hyperbaric conditions, oxygen molecules dissolve directly into the plasma, independent of hemoglobin binding. This elevated oxygen concentration supports the healing of ischemic or hypoxic tissues by:

- Stimulating new blood vessel formation (angiogenesis)
- Reducing inflammation and oxidative stress
- Enhancing the function of immune cells
- Promoting collagen synthesis and tissue regeneration

Typical HBOT Procedures

Patients undergoing HBOT typically enter a pressurized chamber for sessions lasting 60 to 90 minutes. The pressure is usually set between 1.5 and 3 times atmospheric pressure (1.5–3 ATA). Treatments are administered daily or several times per week, with the total number of sessions varying based on the condition being treated.

Mechanisms of HBOT in Addressing Long COVID

Hyperbaric oxygen therapy targets several key pathophysiological mechanisms implicated in long COVID. By improving tissue oxygenation, HBOT can potentially reverse hypoxia-related damage and reduce chronic inflammation that contributes to persistent symptoms.

Reduction of Hypoxia and Tissue Repair

Long COVID symptoms are often linked to microvascular impairment and insufficient oxygen supply to tissues, especially in the brain and lungs. HBOT enhances oxygen delivery, thereby supporting mitochondrial function and cellular metabolism essential for tissue repair and recovery.

Anti-Inflammatory Effects

HBOT has been shown to downregulate pro-inflammatory cytokines and reduce oxidative stress markers. This immunomodulatory effect may alleviate systemic inflammation associated with long COVID and contribute to symptom improvement.

Neurocognitive Improvements

Emerging evidence suggests that HBOT can promote neuroplasticity and cognitive recovery by increasing oxygen availability to brain tissues. This may help address brain fog, memory deficits, and concentration difficulties commonly reported in long COVID patients.

Clinical Evidence Supporting HBOT for Long COVID

Several clinical studies and case reports have evaluated the efficacy of hyperbaric oxygen therapy in patients with long COVID symptoms. Although research is ongoing, initial findings are encouraging and demonstrate significant symptom alleviation in many cases.

Key Clinical Studies

Recent trials have reported improvements in fatigue, cognitive function, and pulmonary capacity following a series of HBOT sessions. For example, a controlled study observed enhanced oxygen saturation levels and reduced inflammatory markers in treated patients compared to controls.

Case Reports and Patient Outcomes

Individual case reports highlight substantial improvements in quality of life and functional status after HBOT treatment. Patients have reported better energy levels, clearer thinking, and decreased shortness of breath, supporting the therapy's potential in long COVID management.

Potential Benefits and Risks of HBOT

While hyperbaric oxygen therapy offers promising benefits for long COVID patients, it is important to consider both its advantages and potential risks to ensure safe and effective treatment.

Benefits of HBOT

- Enhanced oxygen delivery to hypoxic tissues
- Reduction of chronic inflammation and oxidative stress
- Promotion of tissue regeneration and angiogenesis
- Improvement in neurocognitive function and mental clarity
- Potential alleviation of respiratory symptoms and fatigue

Risks and Contraindications

HBOT is generally safe but may cause side effects such as barotrauma (ear or sinus pressure injuries), oxygen toxicity seizures (rare), and claustrophobia. Patients with certain conditions, such as untreated pneumothorax or severe chronic obstructive pulmonary disease, may not be suitable candidates for HBOT. Proper medical evaluation and monitoring are essential.

Patient Selection and Treatment Protocols

Determining which patients with long COVID may benefit from hyperbaric oxygen therapy requires careful clinical assessment. Factors such as symptom severity, duration, comorbidities, and prior treatment responses influence patient eligibility.

Criteria for HBOT Candidacy

- Persistent symptoms consistent with long COVID lasting beyond 12 weeks
- Evidence of tissue hypoxia or impaired oxygenation

- Absence of contraindications to HBOT
- Willingness to undergo multiple treatment sessions

Common Treatment Protocols

Typical protocols involve 20 to 40 HBOT sessions at 1.5 to 2.5 ATA for 60 to 90 minutes each. Treatment frequency varies but is often daily or every other day. Clinical response is monitored regularly to adjust therapy duration and parameters.

Future Perspectives and Research Directions

Continued research into hyperbaric oxygen therapy for long COVID is essential to establish standardized treatment guidelines, optimize protocols, and identify biomarkers predicting response. Large-scale randomized controlled trials are underway to provide robust evidence on safety and efficacy.

Innovations in HBOT Technology

Advances in portable and monoplace hyperbaric chambers may increase accessibility and convenience for patients. Combining HBOT with adjunctive therapies such as rehabilitation and pharmacologic agents is also being explored.

Potential Expansion of Indications

Beyond long COVID, HBOT may have therapeutic potential for other post-viral syndromes and chronic inflammatory conditions that share similar pathophysiological features. Ongoing studies will clarify these possibilities over time.

Frequently Asked Questions

What is hyperbaric oxygen therapy (HBOT) and how is it used for long COVID?

Hyperbaric oxygen therapy (HBOT) involves breathing pure oxygen in a pressurized chamber, which can enhance oxygen delivery to tissues. hyperbaric oxygen therapy long covid: On the Cusp of the Silent Wave of the Long COVID Pandemic: Why, what and how should we tackle this emerging syndrome in the clinic and population? Nuno Sepulveda , Francisco Westermeier, 2024-11-11 Most of the world is happily witnessing a decline in the burden of COVID-19 disease after the global efforts to develop, produce, and deploy anti-SARS-CoV2 vaccines to massive country-level vaccination campaigns. At the same time, this decline is coming at the cost of a silent public crisis due to the rise in the number of people suffering from the post-COVID-19 syndrome (commonly known as long COVID). These people experience a wide set of symptoms, such as persistent fatigue, post-exertional malaise after minimal physical or mental effort, and unrefreshing sleep, representing a substantial healthcare burden worldwide. Some of these people also comply with the current criteria for the diagnosis of Chronic Fatigue Syndrome (CFS), a complex disease often stigmatized by society and neglected by research funders over the years.

hyperbaric oxygen therapy long covid: *Review of Hyperbaric Therapy & Hyperbaric Oxygen Therapy in the Treatment of Neurological Disorders According to Dose of Pressure and Hyperoxia* Paul Gregory Harch,, Enrico M. Camporesi,, Dominic D'Agostino, John Zhang, George Mychaskiw II, Keith Van Meter, 2024-11-18 Hyperbaric therapy and hyperbaric oxygen therapy are treatments that have vexed the medical profession for 359 years. Hyperbaric therapy consisted of the exclusive use of compressed air from 1662 until the 1930s-1950s when 100% oxygen was introduced to recompression tables for diving accidents. Broader clinical application of 100% hyperbaric oxygen to radiation cancer treatment, severe emergent hypoxic conditions, and “blue baby” operations occurred in the late 1950s-1960s. Since that time hyperbaric oxygen therapy has become the dominant term to describe all therapy with increased pressure and hyperoxia. It has been defined as the use of 100% pressurized oxygen at greater than 1.4 or 1.0 atmospheres absolute (ATA) to treat a narrow list of wound and inflammatory conditions determined by expert opinions that vary from country to country. This “modern” definition ignored the previous 300 years of clinical and basic science establishing the bioactivity of pressurized air. The Collet, et al randomized trial of hyperbaric oxygen therapy in cerebral palsy in 2001 exposed the flaws in this non-scientific definition when a pressurized oxygen and a pressurized air group, misidentified as a placebo control group, achieved equivalent and significant cognitive and motor improvements. This study confused the hyperbaric medicine and neurology specialties which were anchored on the 100% oxygen component of hyperbaric oxygen therapy as a necessary requirement for bioactivity. These specialties were blind to the bioactivity of increased barometric pressure and its contribution to the biological effects of hyperbaric/hyperbaric oxygen therapy. Importantly, this confusion stimulated a review of the physiology of increased barometric pressure and hyperoxia, and the search for a more scientific definition of hyperbaric oxygen therapy that reflected its bioactive components (Visit New scientific definitions: hyperbaric therapy and hyperbaric oxygen therapy). The purpose of this Research Topic is to review the science of hyperbaric therapy/hyperbaric oxygen therapy according to its main constituents (barometric pressure, hyperoxia, and possibly increased pressure of inert breathing gases), and review the literature on hyperbaric therapy/hyperbaric oxygen therapy for acute to chronic neurological disorders according to the dose of oxygen, pressure, and inert” breathing gases employed. Contributing authors are asked to abandon the non-scientific and restrictive definition of hyperbaric oxygen therapy with its arbitrary threshold of greater than 1.0 or 1.4 atmospheres absolute of 100% oxygen and adopt the more scientific definitions of hyperbaric and hyperbaric oxygen therapy. Those definitions embody therapeutic effects on broad-based disease pathophysiology according to the effects of increased barometric pressure, hyperoxia, and “inert” breathing gases. Recent basic science research has elucidated some of these effects on gene expression. Researchers have demonstrated that increased pressure and hyperoxia act independently, in an overlapping fashion, and interactively, to induce epigenetic effects that are a function of the dose of pressure and hyperoxia. Differential effects of pressure and hyperoxia were revealed in a systematic review of HBOT in mTBI/PPCS where the effect of pressure was found to be more important than hyperoxia. In retrospect, the net effect of HBO on disease pathophysiology in

both acute and chronic wounding conditions has been demonstrated for decades as an inhibition of inflammation, stimulation of tissue growth, and extensive effects on disease that are pressure and hyperoxic dose-dependent. This Special Topics issue will focus on the scientific definitions of hyperbaric and hyperbaric oxygen therapy, principles of dosing, and an understanding of many neurological diseases as wound conditions of various etiologies. Contributing authors should apply these concepts to articles on the basic science of hyperbaric/hyperbaric oxygen therapy and their clinical applications to acute and chronic neurological diseases.
