images of science fair: Pedagogies of the Image Hannah M. Tavares, 2016-06-15 This work considers the potential of photographs for orienting in a critical direction the scope, questions and

interests of the disciplinary conventions of the field of educational inquiry. Visual objects may help illuminate broader socio-historical events and logics that are deeply entwined with education yet remain marginal to or “outside” of what constitutes its domain of study. In this work photographic images are treated as resources for re-visioning the founding disciplinary objects of educational studies by reorienting its proper objects of study, traditional archives, persistent categories, frames of reference, and accepted portals of research and inquiry. A theoretic framing shapes the question taken up in this work, How might an engagement with photo-archives open new horizons in the study of education from a postfoundationalist, multi-theoretic and cross-disciplinary perspective? The author constructs a rather unconventional vantage point to explore this question that opens on to the discursive spaces of three photographs made of three women in the years 1897, 1949, and 1966. The photographs are analysed from three theoretic approaches. First, it is indicated how each photographic image not only marks a relationship to the past, the present, and the future but to the rules and conventions of photographic practices. These particular images give an account of what both persists and exceeds the photographic image, and permit to rewrite the bodies and lives pictured. Second, the subject matter of each photographic image while singular and local bears witness to the complex network of racial, patriarchal and colonial logics and their profound imbrication with a technically mediated inscription. For all their singularity the photographs cannot but evoke their relation to the deeply historical character of photography. Finally, the photographs make possible an account of broader occurrences, subterranean histories, contexts, and differently situated experiences that illuminate, much like the principle of montage, a sequence of overlapping events crosscutting with one another consequently throwing open the possibility of responding to and transforming the histories and archives we are given. This book 'Pedagogies of the Image' is a winner of the 2017 American Educational Studies Association Critics' Choice Award

images of science fair: Trauma and Meaning Making Danielle Schaub, Elspeth McInnes, 2023-10-20 Trauma and Meaning Making highlights multiple practices of meaning making after traumatic events in the lives of individuals and communities. Meaning making consists both in a personal journey towards a new way to exist and live in a world shattered by trauma and in public politics locating and defining what has happened. In both perspectives, the collection evaluates the impact achieved by naming the victim/s and thus the right of the victim/s to suffer from its aftermath or by refusing to recognise the traumatic event and thus the right of the victim/s to respond to it. A range of paradigms and techniques invite readers to consider anew the specificities of context and relationship while negotiating post-traumatic survival. By delineating how one makes sense of traumatic events, this volume will enable readers to draw links between practices grounded in diverse disciplines encompassing creative arts, textual analysis, public and collective communication, psychology and psychotherapy, memory and memorial.

images of science fair: Hanging Out Ruth Garner, 2002-03-30 There is an unsettledness now in after-school childcare. The stay-at-home mom years are largely over. Will children, even very young children, stay home alone or hang out with peers, risking loneliness or engaging in problem behavior? Will some new form of supervised care emerge? The authors in this collection have spent time in community after-school programs and have learned what happens there. The authors suggest that after-school programs can be an important part of a system of childcare—as long as we can find ways to build programs for small and scattered populations as well as for densely packed ones, and as long as the money to fund programs can be found. The money is important. Many of the programs discussed in this book are specifically targeted to children from families with low incomes. These are the families least likely to be able to pay for care. A reader leaves this book with both anxiety and hope about the future of childcare in the United States.

Mitchell – one of the founders of visual studies – has been at the forefront of many disciplines such as iconology, art history and media studies. His concept of the pictorial turn is known worldwide for having set new philosophical paradigms in dealing with our vernacular visual world. This book will help both students and seasoned scholars to understand key terms in visual studies – pictorial turn, metapictures, literary iconology, image/text, biopictures or living pictures, among many others – while systematically presenting the work of Mitchell as one of the discipline's founders and most prominent figures. As a special feature, the book includes three comprehensive, authoritative and theoretically relevant interviews with Mitchell that focus on different stages of development of visual studies and critical iconology.

images of science fair: Understanding Light Microscopy Jeremy Sanderson, 2019-03-28 Introduces readers to the enlightening world of the modern light microscope There have been rapid advances in science and technology over the last decade, and the light microscope, together with the information that it gives about the image, has changed too. Yet the fundamental principles of setting up and using a microscope rests upon unchanging physical principles that have been understood for years. This informative, practical, full-colour guide fills the gap between specialised edited texts on detailed research topics, and introductory books, which concentrate on an optical approach to the light microscope. It also provides comprehensive coverage of confocal microscopy, which has revolutionised light microscopy over the last few decades. Written to help the reader understand, set up, and use the often very expensive and complex modern research light microscope properly, *Understanding Light Microscopy* keeps mathematical formulae to a minimum—containing and explaining them within boxes in the text. Chapters provide in-depth coverage of basic microscope optics and design; ergonomics; illumination; diffraction and image formation; reflected-light, polarised-light, and fluorescence microscopy; deconvolution; TIRF microscopy; FRAP & FRET; super-resolution techniques; biological and materials specimen preparation; and more. Gives a didactic introduction to the light microscope Encourages readers to use advanced fluorescence and

confocal microscopes within a research institute or core microscopy facility Features full-colour illustrations and workable practical protocols Understanding Light Microscopy is intended for any scientist who wishes to understand and use a modern light microscope. It is also ideal as supporting material for a formal taught course, or for individual students to learn the key aspects of light microscopy through their own study.

images of science fair: Photographs of the Past Bertrand Lavédrine, Jean-Paul Gandolfo, 2009 Photographs of the Past: Processes and Preservation provides a comprehensive introduction to the practice of photograph preservation, bringing together more information on photographic processes than any other single source. In recent years, interest in old photographs has grown significantly among a broad public, from collectors, conservators, and archivists to amateurs seeking to preserve precious family albums. Although the medium of photography is barely 150 years old, its relatively brief history has witnessed the birth of a wide range of photographic processes, each of which poses unique conservation challenges. Introductory chapters cover issues of terminology; the rest of the book is divided into three parts: positives, negatives, and conservation. Each chapter focuses on a single process--daguerreotypes, albumen negatives, black-and-white prints, and so on--providing an overview of its history and materials and tracing the evolution of its technology. This book will serve as an irreplaceable reference work for conservators, curators, collectors, dealers, conservation students, and photographers, as well as those in the general public seeking information on preserving this ubiquitous form of cultural heritage.
