## Design and Materials

The Immersion Research Devil's Club dry suit is crafted using a blend of advanced materials focused on durability, waterproofing, and thermal regulation. The primary fabric is a high-tenacity Cordura nylon combined with a waterproof breathable membrane to prevent water ingress while allowing moisture vapor to escape. This ensures the paddler remains dry and comfortable during extended periods of use. The outer layer's abrasion resistance protects against wear and tear from rocks, branches, and other environmental hazards common in whitewater and coastal paddling scenarios.

## Durable Outer Shell

The outer shell of the Devil's Club dry suit incorporates 3-layer Cordura fabric known for its ruggedness and ability to withstand harsh conditions. This material offers excellent resistance to punctures and abrasions, extending the lifespan of the dry suit. The fabric's breathability is balanced to reduce internal condensation without compromising waterproof integrity.

# Waterproof Membrane Technology

At the core of the dry suit is a high-performance waterproof membrane, which acts as an impermeable barrier against water while allowing perspiration to escape. This membrane technology is critical in maintaining the suit's dryness, particularly in cold water environments where exposure to moisture can lead to hypothermia.

## Sealing and Waterproofing Features

Effective sealing is essential for any dry suit, and the Immersion Research Devil's Club excels with its premium sealing components designed to keep water out. The suit incorporates latex or neoprene seals at the neck and wrists, which provide a snug, flexible fit that prevents leakage while minimizing discomfort.

## Neck and Wrist Seals

The neck seal is constructed from soft, stretchable latex that forms a watertight seal around the neck without restricting movement or breathing. Similarly, the wrist seals employ latex or neoprene depending on the model, ensuring that water cannot enter through these vulnerable points. These seals are replaceable, allowing for easy maintenance and customization to user preferences.

## Zipper Systems

The Devil's Club dry suit features a heavy-duty waterproof zipper, typically positioned in the front or back, designed for secure closure and ease of donning and doffing. The zipper is coated to enhance water resistance and reinforced to withstand frequent use. Double storm flaps often accompany the zipper to provide an additional barrier against water penetration.

## Mobility and Comfort

One of the standout features of the Immersion Research Devil's Club dry suit is its ergonomic design, which prioritizes mobility and user comfort. The suit's patterning allows for a wide range of motion essential for paddling and maneuvering in dynamic water conditions.

## Articulated Patterning

The suit's articulated patterning is engineered to follow the natural contours and movements of the body. This design reduces fabric bunching and restriction, allowing for a full range of arm and leg motion. Articulated knees and elbows enhance flexibility during paddling strokes and portaging.

## **Adjustable Features**

The Devil's Club dry suit includes adjustable waist belts, suspenders, and cuff closures that enable a tailored fit. These features help secure the suit in place, preventing excess fabric from interfering with movement. Additionally, integrated relief zippers or valves may be present to improve convenience during long sessions on the water.

## **Sizing and Fit Options**

Immersion Research offers the Devil's Club dry suit in a broad range of sizes to accommodate paddlers of varying body types. Proper fit is critical to ensure both comfort and effectiveness in waterproofing.

## **Standard and Custom Sizing**

Standard sizing options range from small to extra-large, with detailed measurement charts available to guide selection. For paddlers with unique body dimensions, custom sizing can be ordered to ensure precise fit, enhancing both comfort and performance.

## **Gender-Specific Designs**

The Devil's Club dry suit is available in both men's and women's versions. Gender-specific cuts address differences in body shape, providing better mobility and comfort tailored to individual anatomy.

## **Maintenance and Care**

Proper maintenance of the Immersion Research Devil's Club dry suit is essential to preserve its waterproofing capabilities and extend its lifespan. Regular care prevents seal degradation and fabric wear.

## **Cleaning Guidelines**

After use, the suit should be rinsed with fresh water to remove dirt, salt, and contaminants. Mild soap can be used for thorough cleaning, but harsh detergents should be avoided as they can damage waterproof membranes.

## **Seal Care and Replacement**

Neck and wrist seals require regular inspection for cracks or tears. Applying silicone lubricant can help maintain their suppleness. When seals become worn, they should be replaced promptly to prevent leaks.

## **Storage Recommendations**

The dry suit should be stored in a cool, dry place, hung loosely to avoid creases and stress on seals. Avoid prolonged exposure to direct sunlight or heat sources, which can degrade materials.

## **Choosing the Right Immersion Research Devil's Club Dry Suit**

Selecting the ideal dry suit depends on the intended use, environmental conditions, and individual preferences. The Immersion Research Devil's Club dry suit offers versatility suitable for a range of paddling disciplines, from whitewater kayaking to coastal touring.

- Assess climate and water temperatures to determine necessary insulation layers.
- Consider mobility requirements based on paddling style and activity intensity.
- Evaluate sizing options carefully to ensure a secure, comfortable fit.
- Review additional features such as pockets, relief zippers, and reinforcement panels.
- Factor in maintenance capabilities and availability of replacement parts.

By accounting for these factors, paddlers can select an Immersion Research Devil's Club dry suit model that optimizes safety, comfort, and durability for their specific aquatic adventures.

Michel B. Ducharme, DEFENCE AND CIVIL INST OF ENVIRONMENTALMEDICINE DOWNSVIEW (Ont.), 2002 A new concept of immersion suit, the nearly dry suit, was recently developed to overcome the main limitations of the wet and dry suits. The main new feature of the suit is the adjustable seals that can be closed before or upon entry in water. The purpose of the present study was to test the new suit at sea against a standard dry suit. Seven male subjects were immersed for over one hour in 3 deg water in the Atlantic ocean. Three conditions were tested during which the subjects were wearing a dry suit (DRY), a nearly dry suit with the seals closed (NEAR-DRY-C) or a nearly dry suit with the seals opened upon entry in water (NEAR-DRY-O). The thermal resistance of the suit, measured from the skin heat loss data and the temperature difference between the skin and the outside surface of the suits, were  $0.95 \pm 0.14$ ,  $0.69 \pm 0.13$  and  $0.58 \pm 0.09$  Clo for DRY, NEAR-DRY-C and NEAR-DRY-O conditions, respectively, with the thermal resistance being significantly lower (p
