Asmatulu, 2013-06-12 The importance of construction and infrastructures cannot be undermined. Buildings, roads, bridges, dams, transportation systems, and other infrastructures have brought the nations of the world together in many ways and made it a much smaller place. This chapter mainly talks about the world's construction industry and the advancement of new materials and technologies in the field of nanotechnology. It also discusses the shift toward sustainable development in the construction industry and how this development is applied by construction companies. Nanotechnology is pushing construction and infrastructure industries to use more efficient nanomaterials in order to make "smarter" building structures and infrastructures. However, the role of various nanomaterials in the construction industry has been debated. The widespread trend of using nanomaterials has been discouraged because of the biological and environmental health and safety impacts of using nanomaterials in construction and infrastructures. Governmental agencies are currently playing a major role in establishing rules and regulations that govern proper and efficient handling and use of nanomaterials. This study provides a look at the current situation and offers suggestions for continuing on our path toward sustainable development in the field.

mechanical engineering wichita state: Nanotechnology Safety Waseem S. Khan, Ramazan Asmatulu, 2013-06-12 Nanotechnology is the fastest-growing technology in the world, and it is also called the Industrial Revolution of the twenty-first century. Many research, development, and manufacturing methods have been used globally to develop better and safer nanomaterials for various applications. Nanotechnology teaches us the critical properties of day-to-day materials and structures. The invention of the scanning tunneling microscope (STM), carbon nanotubes (CNTs), and fullerenes (or buckyballs) laid a path toward nanotechnology because atomic- and molecular-level studies could be performed using the STM and nanomaterials. Today this technology is employed in various fields such as engineering, technology, applied sciences, biomedical, pharmaceuticals, food and agriculture, and construction industries. The number of technical articles and patents related to nanotechnology and nanoproducts has been continuously increasing for nearly two decades. Within 10 or 15 years, it is expected that the industrial production of nanotechnology will be worth over \$1 trillion. Thus, this technology will drastically change science, education, manufacturing, and the lifestyles of people around the world.

mechanical engineering wichita state: Nanotechnology Safety H. Haynes, Ramazan Asmatulu, 2013-06-12 Nanomaterials, which take the form of particles, tubes, films, composites, wires, flakes, and fibers, are used for various purposes in the aerospace industry because of their extraordinary physiochemical properties. Some nanomaterials can enter the human body via inhalation, ingestion, and/or skin contact during the fabrication, machining, transportation, and assembly of components, and they can stay in the body for a long period of time. Because nanomaterials are composed of different compounds with various surface areas, sizes, shapes, surface charges, and energies, they can interact with human tissue, damage or kill cells and organs, block blood flow, and cause serious illnesses. This chapter discusses the application of nanomaterials in the aerospace industry, the health and safety issues related to nanomaterials, and the methods of protection used against their harmful effects.
