Understanding Preference Assessments in ABA

Preference assessments are systematic procedures used in Applied Behavior Analysis to identify stimuli that an individual finds motivating. These stimuli, once identified, can be used as reinforcers to encourage desired behaviors. The importance of preference assessments lies in their ability to enhance treatment efficacy by ensuring that the reinforcers used are genuinely appealing to the learner. Preference assessments are especially valuable for individuals with limited communication skills or those who cannot easily express their likes and dislikes.

Purpose and Importance

The primary purpose of preference assessments is to improve intervention outcomes by selecting highly preferred items or activities as reinforcers. In ABA therapy, reinforcement plays a pivotal role in behavior

acquisition and maintenance. If reinforcers are not motivating, the effectiveness of the intervention may be compromised. Preference assessments help avoid this by providing objective data on what the individual prefers, thus increasing the likelihood of successful behavior change.

When to Conduct Preference Assessments

Preference assessments should be conducted prior to the initiation of any new intervention requiring reinforcement. Additionally, they are useful when a previously effective reinforcer loses its appeal or when working with new clients whose preferences are not yet known. Periodic reassessment is recommended to account for changes in preferences over time, ensuring that reinforcement remains effective.

Common Types of Preference Assessments

There are several standardized types of preference assessments commonly used in ABA settings. Each type has unique procedures and applications, allowing practitioners to select the most appropriate method based on the individual's communication abilities, attention span, and the number of stimuli available.

Single-Stimulus Preference Assessment

The single-stimulus method, also known as the successive choice or successive presentation method, involves presenting one item at a time to the individual and recording their response, such as engagement or approach. This method is simple and effective for individuals with limited discrimination skills or those who may become overwhelmed by choices.

Paired-Stimulus Preference Assessment

In the paired-stimulus or forced-choice method, two items are presented simultaneously, and the individual selects one. Each item is paired with every other item in a systematic manner. This approach provides a hierarchy of preferences by determining which item is chosen more frequently when paired with others. It is useful for individuals who can discriminate between different stimuli.

Multiple Stimulus Preference Assessment

The multiple stimulus method presents several items at once, either with replacement or without replacement. The individual selects their preferred item, and the chosen item is either replaced or removed for subsequent trials. This method is efficient and generates a ranked list of preferences quickly, suitable for individuals with higher cognitive skills.

Preference Assessment ABA Example: Step-by-Step

To illustrate the practical application of a preference assessment, consider an example using the paired-stimulus method. This example demonstrates how to conduct the assessment, record data, and analyze the results to identify effective reinforcers.

Step 1: Gather Potential Reinforcers

Collect a variety of items and activities that might be preferred by the individual. These can include toys, snacks, sensory items, or leisure activities. It is essential to have a diverse selection to accurately capture the individual's preferences.

Step 2: Prepare the Assessment Environment

Set up a quiet, distraction-free environment to conduct the assessment. Arrange the items so that they can be easily presented in pairs without interference. Ensure that the individual is comfortable and ready to participate.

Step 3: Conduct the Paired-Stimulus Trials

Present two items at a time and prompt the individual to select one. Record the choice made during each trial. Each item should be paired with every other item, resulting in multiple trials. For example, with five items, there would be ten unique pairs.

Step 4: Record and Tabulate Data

Use a data sheet to mark the selected item in each pair. Tally the number of times each item is chosen across all pairs. This data will form the basis for determining the preference hierarchy.

Step 5: Analyze Results and Rank Preferences

Calculate the percentage of times each item was selected out of the total opportunities. Items with higher selection percentages are considered more preferred. Rank the items from most to least preferred to guide reinforcer selection in therapy sessions.

Interpreting Results and Selecting Reinforcers

Accurate interpretation of preference assessment data is crucial for selecting effective reinforcers in ABA interventions. Understanding the preference hierarchy allows practitioners to tailor reinforcement strategies to the individual's motivations.

Establishing a Preference Hierarchy

Preference assessments generate a hierarchy that ranks items from most to least preferred based on selection frequency. Items at the top of the hierarchy are typically used as primary reinforcers, while lower-ranked items may serve as secondary reinforcers or be excluded from the intervention.

Incorporating Preferences into ABA Programs

Once preferred stimuli are identified, they should be integrated systematically into ABA programs. Reinforcers should be delivered contingent upon the desired behavior to maximize motivation. It is also important to monitor the effectiveness of reinforcers over time and adjust as needed.

Considerations for Reinforcer Effectiveness

Reinforcer effectiveness can vary depending on the context, individual state (e.g., hunger, fatigue), and novelty of the stimulus. Rotating reinforcers or conducting periodic preference assessments can help maintain motivation and prevent satiation.

Challenges and Best Practices in Preference Assessments

While preference assessments are valuable tools, several challenges can affect their accuracy and utility. Recognizing these challenges and applying best practices enhances the reliability of the results.

Challenges in Conducting Preference Assessments

- **Limited Communication:** Individuals with minimal communication skills may not clearly indicate preferences, complicating assessments.
- **Variability in Preferences:** Preferences can fluctuate due to mood, environment, or satiation, impacting consistency.

- **Overselection or Undeselection:** Some individuals may select items randomly or avoid making choices, reducing data validity.
- **Stimulus Familiarity:** Unfamiliar items may be overlooked, skewing preference results.

Best Practices for Effective Preference Assessments

- Use a variety of assessment types tailored to the individual's abilities and needs.
- Include a broad range of stimuli to capture diverse preferences.
- Conduct assessments in a consistent, distraction-free environment.
- Repeat assessments periodically to account for changing preferences.
- Combine preference assessments with direct observation and caregiver input for comprehensive understanding.

Frequently Asked Questions

What is a preference assessment in ABA?

A preference assessment in ABA (Applied Behavior Analysis) is a systematic method used to identify preferred items or activities that can be used as potential reinforcers to motivate behavior change.

Can you give an example of a preference assessment used in ABA?

One common example is the Multiple Stimulus Without Replacement (MSWO) assessment, where several items are presented to the individual, and they select their preferred items in a sequence without replacement to determine ranking.

Why are preference assessments important in ABA therapy?

Preference assessments help identify what motivates an individual, ensuring that the reinforcers used in therapy are effective and increase the likelihood of desired behaviors.

How does a single stimulus preference assessment work?

In a single stimulus preference assessment, items or activities are presented one at a time to the individual, and their reaction or engagement with each item is recorded to identify preferences.

What is an example of a paired stimulus preference assessment?

In a paired stimulus assessment, two items are presented at a time, and the individual chooses one. This process is repeated with different pairs to rank preferences. For example, presenting a toy car versus a ball multiple times to see which is consistently chosen.

How often should preference assessments be conducted in ABA?

Preference assessments should be conducted regularly, as preferences can change over time. Many practitioners assess preferences before starting new programs or when current reinforcers lose effectiveness.

Can preference assessments be used with individuals who have limited communication skills?

Yes, preference assessments are often designed for individuals with limited communication abilities, using observation of behaviors such as reaching, eye gaze, or engagement to determine preferences.

What is an example of using a preference assessment result in ABA?

If a preference assessment reveals that a child prefers playing with bubbles over other activities, the therapist might use bubble play as a reinforcer to encourage desired behaviors during sessions.

In this eBook, we present several articles addressing the relationships between children/juveniles and animals in different countries, including Austria, Germany, Jamaica, Japan, the United Kingdom and the United States. Three articles discuss approaches in animal-assisted education, including animal keeping and animal assisted interventions in schools, and an experimental study investigating immediate effects of dogs on reading competence and accompanying stress reactions with cortisol and behavior. Other articles address topics involving children and their companion animals, including dog-walking by children and juveniles, risks of dog bites by the family dog, selection of pet dogs for families with a child with autism spectrum disorder (ASD) and the relationships that children with ASD have with their family cats. The interactions between children/juveniles and animals addressed in this eBook provide new insights into some scarcely investigated themes, and underline the significance of animals in children's lives.
