princeton university chemistry faculty: *Changing the Game* Nancy Weiss Malkiel, 2023-11-14 How a visionary university and foundation president tackled some of the thorniest problems facing

higher education As provost and then president of Princeton University, William G. Bowen (1933–2016) took on the biggest and most complex challenges confronting higher education: cost disease, inclusion, affirmative action, college access, and college completion. Later, as president of the Andrew W. Mellon Foundation, he took his vision for higher education—and the strategies for accomplishing that vision—to a larger arena. Along the way, he wrote a series of influential books, including the widely read *The Shape of the River* (coauthored with Derek Bok), which documented the success of policies designed to increase racial diversity at elite institutions. In *Changing the Game*, drawing on deep archival research and hundreds of interviews, Nancy Weiss Malkiel argues that Bowen was the most consequential higher education leader of his generation. Bowen, who became Princeton's president in 1972 at the age of 38, worked to shore up the university's financial stability, implement coeducation, and create a more inclusive institution. Breaking through the traditional Ivy League demographics of white, Protestant, and male, he embraced equal access in admissions for women and men and actively sought to enroll Black, Hispanic, and Asian American students. To "increase the intellectual muscle of the faculty," he used targeted recruiting and enforced higher scholarly standards. In 1988, Bowen moved on to Mellon, where, among many other accomplishments, he developed digital research tools, most notably JSTOR, and promoted racial diversity through the Mellon Mays Undergraduate Fellowship. Attacking problems with tenacity, insight, and deep knowledge, Bowen showed the world of higher education how a visionary leader can transform an institution.

princeton university chemistry faculty: Advancing Women in Science Willie Pearson, Jr.,

Lisa M. Frehill, Connie L. McNeely, 2015-04-23 Many countries have implemented policies to increase the number and quality of scientific researchers as a means to foster innovation and spur economic development and progress. To that end, grounded in a view of women as a rich, yet underutilized knowledge and labor resource, a great deal of recent attention has focused on encouraging women to pursue education and careers in science — even in countries with longstanding dominant patriarchal regimes. Yet, overall, science remains an area in which girls and women are persistently disadvantaged. This book addresses that situation. It bridges the gap between individual- and societal-level perspectives on women in science in a search for systematic solutions to the challenge of building an inclusive and productive scientific workforce capable of creating the innovation needed for economic growth and societal wellbeing. This book examines both the role of gender as an organizing principle of social life and the relative position of women scientists within national and international labor markets. Weaving together and engaging research on globalization, the social organization of science, and gendered societal relations as key social forces, this book addresses critical issues affecting women's contributions and participation in science. Also, while considering women's representation in science as a whole, examinations of women in the chemical sciences, computing, mathematics and statistics are offered as examples to provide insights into how differing disciplinary cultures, functional tasks and socio-historical conditions can affect the advancement of women in science relative to important variations in educational and occupational realities. Edited by three social scientists recognized for their expertise in science and technology policy, education, workforce participation, and stratification, this book includes contributions from an intellectually diverse group of international scholars and analysts and features compelling cases and initiatives from around the world, with implications for research, industry practice, education and policy development.

Crofts, 2014-06-28 The Oxygen Evolving System of Photosynthesis documents the proceedings of an international symposium entitled Photosynthetic Water Oxidation and Photosystem II Photochemistry, held at The Institute of Physical and Chemical Research (RIKEN), Wako, Saitama, Japan, 15-17 March 1983. Several other papers from authorities in this field are also included. This book provides in a systematic fashion the most current thoughts and insights into the field of photosynthetic oxygen evolution. The volume contains 46 chapters organized into five parts. Part I deals with the subunit structure of photosystem II reaction center pigment proteins and the charge separation (generation of positive and negative charges, P680+ and Pheo-). Part II examines the components and their function on the donor side. Part III discusses the biochemistry of the water oxidation enzyme system, polypeptide composition, and functional reconstitution. Part IV take up the functions of chloride and bicarbonate in electron transport and the mechanism of photoactivation in latent or Tris-inactivated chloroplasts. Part V discusses the fate of reducing equivalents going through the two-electron gate mechanism, together with the biochemistry of the quinone components on the acceptor side.

princeton university chemistry faculty: *Engineering Crystallography: From Molecule to Crystal to Functional Form* Kevin J. Roberts, Robert Docherty, Rui Tamura, 2017-07-18 This book highlights the current state-of-the-art regarding the application of applied crystallographic methodologies for understanding, predicting and controlling the transformation from the molecular to crystalline state with the latter exhibiting pre-defined properties. This philosophy is built around the fundamental principles underpinning the three inter-connected themes of Form (what), Formation (how) and Function (why). Topics covered include: molecular and crystal structure, chirality and ferromagnetism, supramolecular assembly, defects and reactivity, morphology and surface energetics. Approaches for preparing crystals and nano-crystals with novel physical, chemical and mechanical properties include: crystallisation, seeding, phase diagrams, polymorphic control, chiral separation, ultrasonic techniques and mechano-chemistry. The vision is realised through examination of a range of advanced analytical characterisation techniques including in-situ studies. The work is underpinned through an unprecedented structural perspective of molecular features, solid-state packing arrangements and surface energetics as well as in-situ studies. This work will be of interest to researchers, industrialists, intellectual property specialists and policy makers interested in the latest developments in the design and supply of advanced high added-value organic solid-form materials and product composites.

princeton university chemistry faculty: *Bioinspired Chemistry for Energy* National Research Council, Division on Earth and Life Studies, Board on Chemical Sciences and Technology, Chemical Sciences Roundtable, 2008-05-07 Faced with the steady rise in energy costs, dwindling fossil fuel supplies, and the need to maintain a healthy environment - exploration of alternative energy sources is essential for meeting energy needs. Biological systems employ a variety of efficient ways to collect, store, use, and produce energy. By understanding the basic processes of biological models, scientists may be able to create systems that mimic biomolecules and produce energy in an efficient and cost effective manner. On May 14-15, 2007 a group of chemists, chemical engineers, and others from academia, government, and industry participated in a workshop sponsored by the Chemical Sciences Roundtable to explore how bioinspired chemistry can help solve some of the important energy issues the world faces today. The workshop featured presentations and discussions on the current energy challenges and how to address them, with emphasis on both the fundamental aspects and the robust implementation of bioinspired chemistry for energy.
