Fundamental Supply Chain Concepts

Understanding fundamental supply chain management terms is crucial for grasping the broader logistics and operational processes within any organization. These basic concepts form the building blocks of supply chain knowledge and are frequently used across all industries.

Supply Chain

The supply chain refers to the entire network involved in producing and delivering a product or service, from raw materials to the end customer. It includes suppliers, manufacturers, warehouses, transporters, retailers, and consumers, all interconnected through processes and information flow.

Supply Chain Management (SCM)

Supply Chain Management is the strategic coordination of business functions within a company and across businesses within the supply chain. Its goal is to improve efficiency, reduce costs, and ensure customer satisfaction by optimizing the flow of goods, services, and information.

Demand Forecasting

Demand forecasting involves predicting future customer demand using historical data, market trends, and statistical tools. Accurate forecasting is essential for effective inventory management and production planning, reducing the risk of stockouts or excess inventory.

Lead Time

Lead time is the total time taken from the initiation of a process until its completion. In supply chains, it refers to the time between placing an order and receiving the goods. Managing lead time is critical for maintaining smooth operations and meeting customer expectations.

Inventory and Warehousing Terms

Inventory and warehousing are vital components of supply chain management, involving the storage and control of goods before they reach the consumer. Understanding related terms helps in optimizing stock levels and warehouse operations.

Inventory

Inventory refers to the raw materials, work-in-progress goods, and finished products held by a company. Proper inventory management balances availability with cost-efficiency, preventing overstocking or stockouts.

Safety Stock

Safety stock is the additional quantity of inventory kept as a buffer to protect against uncertainties in demand or supply delays. It ensures product availability even when unexpected disruptions occur.

Warehouse Management System (WMS)

A Warehouse Management System is software designed to optimize warehouse operations, including inventory tracking, order picking, and shipping. WMS improves accuracy, efficiency, and overall supply chain responsiveness.

Stock Keeping Unit (SKU)

A SKU is a unique identifier assigned to each distinct product or item for inventory tracking purposes. SKUs enable precise monitoring of stock levels and facilitate efficient order processing.

Inventory Turnover

Inventory turnover measures how often inventory is sold and replaced over a specific period. High turnover indicates efficient inventory management, while low turnover may signal overstocking or slow sales.

Logistics and Transportation Terminology

Logistics and transportation are critical to moving products through the supply chain efficiently. Familiarity with these terms supports better planning and execution of distribution activities.

Logistics

Logistics encompasses the planning, implementation, and control of the movement and storage of goods, services, and related information from the point of origin to the point of consumption.

Freight Forwarder

A freight forwarder is an intermediary that arranges transportation of goods on behalf of shippers, coordinating logistics such as carrier selection, documentation, and customs clearance.

Cross-Docking

Cross-docking is a logistics procedure where incoming goods are directly unloaded from inbound transport and loaded onto outbound vehicles with minimal or no storage time, reducing handling and storage costs.

Transportation Management System (TMS)

A TMS is software designed to plan, execute, and optimize the physical movement of goods. It enhances route planning, carrier selection, and freight cost management.

Bill of Lading (BOL)

The Bill of Lading is a legal document issued by a carrier to a shipper, detailing the type, quantity, and destination of the goods being carried. It serves as a shipment receipt and contract.

Procurement

Procurement is the process of sourcing and purchasing goods or services needed by an organization. It involves vendor selection, negotiation, and contract management.

Supplier Relationship Management (SRM)

SRM refers to the strategic approach to managing interactions with suppliers to maximize value, reduce risk, and ensure consistent quality and delivery performance.

Purchase Order (PO)

A purchase order is a formal document issued by a buyer to a supplier, specifying the products, quantities, and agreed prices. It serves as a contractual agreement for the transaction.

Just-in-Time (JIT)

Just-in-Time is an inventory strategy where materials are ordered and received only as needed for production, minimizing inventory costs and reducing waste.

supply chain management terms: ERP Systems for Manufacturing Supply Chains Odd Jøran

Sagegg, Erlend Alfnes, 2020-02-24 ERP Systems for Manufacturing Supply Chains: Applications, Configuration, and Performance provides insight into the core architecture, modules, and process support of ERP systems used in a manufacturing supply chain. This book explains the building blocks of an ERP system and how they can be used to increase performance of manufacturing supply chains. Starting with an overview of basic concepts of supply chain and ERP systems, the book delves into the core ERP modules that support manufacturing facilities and organizations. It examines each module's structure and functionality as well as the process support the module provides. Cases illustrate how the modules can be applied in manufacturing environments. Also covered is how the ERP modules can be configured to support manufacturing supply chains. Setting up an ERP system to support the supply chain within single manufacturing facility provides insight into how an ERP system is used in the smallest of manufacturing enterprises, as well as lays the foundation for ERP systems in manufacturing organizations. The book then supplies strategies for larger manufacturing enterprises and discusses how ERP systems can be used to support a complete manufacturing supply chain across different facilities and companies. The ERP systems on the market today tend to use common terminology and naming for describing specific functions and data units in the software. However, there are differences among packages. The book discusses various data and functionalities found in different ERP-software packages and uses generic and descriptive terms as often as possible to make these valid for as many ERP systems as possible. Filled with insight into ERP system's core modules and functions, this book shows how ERP systems can be applied to support a supply chain in the smallest of manufacturing organizations that only consist of a single manufacturing facility, as well as large enterprises where the manufacturing supply chain crosses multiple facilities and companies.

supply chain management terms: **Developing a Framework for Supply Chain Planning in Construction** Micael Thunberg, 2016-09-28 Supply chain management (SCM) has been stressed as a remedy to many of the underlying issues in the construction industry. However, the positive examples where SCM has been successfully utilised and diminished the lingering issues in construction is scarce. The question is why. Previous studies have stressed the importance of planning both the construction project as such but also the supply chain and the logistics. As an important part of SCM, supply chain planning (SCP) focuses on planning different aspects of the supply chain through involving different members of the supply chain in the planning process. SCP in construction is scarce as the planning of the logistics in general. Failing to plan the supply chain, involving supply chain members in the planning, and integrating the processes of planning the supply chains and the construction project can be one reason for the low numbers of successful SCM adoption in construction. In improving the SCP in construction, this thesis develops a SCP framework for construction that involves the main contractor, subcontractors, and suppliers. The aim is to improve SCP, collaboration, and eliminate many of the common problems in construction through a SCM and SCP perspective. The developed framework is based on an existing planning framework for sales and operations planning. This framework is generic and synthesises planning in general. It consists of identifying/developing: outcomes, input, organisation, process, key performance measurements, and IT-tools. It is thus necessary to investigate what these aspects means in a construction context. Four research objects will be fulfilled: Objective 1. Identify common logistical problems and linkages between them Objective 2. Develop a SCP process Objective 3. Develop a SCP organisation Objective 4. Identify performance measurements
