technology in the 60s: *Science, Technology and Society in Postwar Japan* Shigeru Nakayama, 2013-10-28 First published in 1991. The study of Japanese science and technology (especially technology) is a fashionable subject at the present time, and numerous English language works appear month by month claiming to explain the 'miracle' of the recent rise of Japanese technology. Most of these works are, however, seem to be superficial treatments of Japan's recent technological performance, lacking in historical insight. This book is an attempt to introduce a critical examination of the mechanisms by which Japan has promoted science and technology by looking at its post-war historical development.

technology in the 60s: Public Technology Procurement and Innovation Charles Edquist, Leif Hommen, Lena Tsipouri, 2012-12-06 *Public Technology Procurement and Innovation* studies public technology procurement as an instrument of innovation policy. In the past few years, public technology procurement has been a relatively neglected topic in the theoretical and research literature on the economics of innovation. Similarly, preoccupation with 'supply-side' measures has led policy-makers to avoid making very extensive use of this important 'demand-side' instrument. These trends have been especially pronounced in the European Union. There, as this book will argue, existing legislation governing public procurement presents obstacles to the use of public technology procurement as a means of stimulating and supporting technological innovation. Recently, however, there has been a gradual re-awakening of practical interest in such measures among policy-makers in the EU and elsewhere. For these and other related measures, this volume aims to contribute to a serious reconsideration of public technology procurement from the complementary standpoints of innovation theory and innovation policy.

technology in the 60s: *Cooperation Networks and Economic Development* Andrés Cárdenas O'Farrill, 2021-02-11 For most Western audiences, Cuba is a touristic paradise stuck in time and virtually detached from world technology networks by the US embargo – anything but a hub of industrial innovation and high value-added biotechnology. However, a closer look reveals more subtle but equally powerful stories that challenge the homogenizing assumptions of conventional economics and open up scope for more sophisticated reflections on Cuban economy and industry. From this kind of enquiry emerges the case of the internationally respected Cuban biotech industry as the most successful case of science and technology policy in the country's economic history. The book takes an interdisciplinary approach, exploring issues such as interdependency, purpose and history as natural constituencies of the innovation process. It also examines the dynamic and crucial role played by the state in the formation of innovative business enterprises. This book will be of interest to academic researchers in the fields of innovation and economic development.

technology in the 60s: Digital Performance Steve Dixon, 2007-02-23 The historical roots, key practitioners, and artistic, theoretical, and technological trends in the incorporation of new media into the performing arts. The past decade has seen an extraordinarily intense period of experimentation with computer technology within the performing arts. Digital media has been increasingly incorporated into live theater and dance, and new forms of interactive performance have emerged in participatory installations, on CD-ROM, and on the Web. In Digital Performance, Steve Dixon traces the evolution of these practices, presents detailed accounts of key practitioners

and performances, and analyzes the theoretical, artistic, and technological contexts of this form of new media art. Dixon finds precursors to today's digital performances in past forms of theatrical technology that range from the deus ex machina of classical Greek drama to Wagner's Gesamtkunstwerk (concept of the total artwork), and draws parallels between contemporary work and the theories and practices of Constructivism, Dada, Surrealism, Expressionism, Futurism, and multimedia pioneers of the twentieth century. For a theoretical perspective on digital performance, Dixon draws on the work of Philip Auslander, Walter Benjamin, Roland Barthes, Jean Baudrillard, and others. To document and analyze contemporary digital performance practice, Dixon considers changes in the representation of the body, space, and time. He considers virtual bodies, avatars, and digital doubles, as well as performances by artists including Stelarc, Robert Lepage, Merce Cunningham, Laurie Anderson, Blast Theory, and Eduardo Kac. He investigates new media's novel approaches to creating theatrical spectacle, including virtual reality and robot performance work, telematic performances in which remote locations are linked in real time, Webcams, and online drama communities, and considers the extratemporal illusion created by some technological theater works. Finally, he defines categories of interactivity, from navigational to participatory and collaborative. Dixon challenges dominant theoretical approaches to digital performance—including what he calls postmodernism's denial of the new—and offers a series of boldly original arguments in their place.
