wit women in technology: Information and Communication Technologies for Women's Socioeconomic Empowerment Samia Melhem, Claudia Morrell, Nidhi Tandon, 2009-10-02 This paper reviews how women in the developing world access and use information and communication technology (ICT). It examines the discourse and controversies surrounding the digital gender divide, including links to poverty and illiteracy. Major themes concerning women and ICTs are explored, such as women in the ICT workforce, how girls and women relate differently to ICT, and opportunities and barriers for women in science and technology in general. Current research relating to gender and ICT is often country-specific and is more prevalent in developed countries than in developing countries. This paper suggests where additional research is needed on barriers to women's entry and access to ICT. The overall objective of this paper is to influence policy dialogue around women and ICT for development by raising awareness of the digital gender divide. Economic opportunity for women in ICT will not be realized until policies address gender considerations and ensure that ICT investment contributes to more sustainable and equitable development.

wit women in technology: Retaining Women in Tech Karen Holtzblatt, Nicola Marsden, 2022-03-01 For over 40 years, the tech industry has been working to attract more women. Yet, women continue to be underrepresented in technology jobs compared to other professions. Worse, once hired, women leave the field mid-career twice as often as men. In 2013, Karen Holtzblatt launched The Women in Tech Retention Project at WITops.org, dedicated to understanding what helps women in tech thrive. In 2014, Nicola Marsden joined the effort, bringing her extensive knowledge and research on gender and bias for women in tech. Together with worldwide volunteers, this research identified what helps women thrive and practical interventions to improve women's experience at work. In this book, we share women's stories, our research, relevant literature, and our perspective on making change to help retain women. All the research and solutions we share are based on deep research and user-centered ideation techniques. Part I describes the @Work Experience Framework and the six key factors that help women thrive: a dynamic valuing team; stimulating projects; the push into challenges with support; local role models; nonjudgmental flexibility to manage home/work balance; and developing personal power. Employees thinking of leaving their job have significantly lower scores on these factors showing their importance for retention. Part II describes tested interventions that redesign work practices to better support women, diverse teams, and all team members. We chose these interventions guided by data from over 1,000 people from multiple genders, ethnicities, family situations, and countries. Interventions target key processes in tech: onboarding new hires; group critique meetings; and Scrum. Interventions also address managing interpersonal dynamics to increase valuing and decrease devaluing behaviors and techniques for teams to define, monitor, and continuously improve their culture. We conclude by describing our principles for redesigning processes with an eye toward

issues important to women and diverse teams.

This reference work will be an essential guide for government professionals, students, and researchers in the ICT field looking to develop a solution to equalize the retention rate of women in these related fields.

wit women in technology: Science and the Construction of Women (RLE Feminist Theory) Mary Maynard, 2012-11-12 *Science and the Construction of Women* is a multi-disciplinary exploration of the major questions currently challenging feminist scholars of science. The authors ask key questions: What constitutes science? How have feminists investigated it? How does science 'construct' women? How can we create a feminist discourse of science? Are the current developments to women's advantage or disadvantage? Their answers draw on material from a wide range of natural scientific, humanities and social science sources, critically examining theoretical approaches from the postmodern to the materialist to the cyborgian. A key argument of the book is that there are strong intellectual and pragmatic reasons – the rapid development of information technology, advances in fertility treatment and genetic engineering, feminist concern for environmental issues – why feminism must rigorously engage with issues of a scientific and technological nature. *Science and the Construction of Women* provides an important contribution to the opening-up and broadening of debate in the field. This book will be an important text for students of gender and women's studies, and science studies. It is also designed to be read by feminists both inside and outside the academy and to appeal to all those with interests in the sociology of knowledge and the history of ideas.

wit women in technology: Women into Computing Gillian Lovegrove, Barbara Segal, 2013-06-29 This book contains the majority of the papers presented at the 1990 Women into Computing Conference, together with selected papers from the 1989 and 1988 Conferences. In 1988, the main theme running through the Conference was that of dismay at the low number of women taking computing courses or following computing careers. The 1989 Conference was concerned solely with workshops for schoolgirls and the 1990 Conference concentrated on strategies rather than an assessment of the situation. As editors, we set as our task to make a selection of papers presenting the overall picture in 1990. We found that many of the issues discussed in 1988 are still a cause for concern in 1990, but that strategies to improve the situation are many and varied. Section I contains speeches from the invited speakers and needs little introduction. Section II contains papers covering some attitudes and issues of concern, ranging from the specific (Gill Russell on child care and Laurie Keller on hacker mentality) through to broader aspects of gender inequality (the papers of Flis Henwood, Margaret Bruce and Alison Adam, and Lyn Bryant). Susan Jones takes a look at the reasons why we should want to see more women in computing, whilst Gillian Lovegrove and Wendy Hall present a more general paper on school and higher education.

wit women in technology: Artificial Knowing Alison Adam, 2006-07-13 *Artificial Knowing* challenges the masculine slant in the Artificial Intelligence (AI) view of the world. Alison Adam admirably fills the large gap in science and technology studies by showing us that gender bias is inscribed in AI-based computer systems. Her treatment of feminist epistemology, focusing on the ideas of the knowing subject, the nature of knowledge, rationality and language, are bound to make a significant and powerful contribution to AI studies. Drawing from theories by Donna Haraway and Sherry Turkle, and using tools of feminist epistemology, Adam provides a sustained critique of AI which interestingly re-enforces many of the traditional criticisms of the AI project. *Artificial Knowing* is an essential read for those interested in gender studies, science and technology studies, and philosophical debates in AI.
